

Capacitive level transmitter / -switch incl. temperature control LCC2

- Developed for oil containers with highly disturbed level of fill
- No moving parts
- Automatic recognition of different types of oil via reference capacitance
- Temperature control can be integrated
- Switching output (push-pull) and analog output (4..20 mA or 0..10 V)
- Parameters can be programmed in order to achieve best possible adaptation to the application
- Simple adjustment
- Thread or flange fastening
- Compact size

Characteristics

The capacitive LCC2 oil measurer and switch monitors the level of the oil, even in containers with heavily mobile oil surfaces (compressors, engine oil sumps, gearboxes...).

The LCC2 measures the level in relationship to a reference structure at the end of the probe. As a result, levels are correctly detected with oil changes (different viscosity, at different temperatures or in the case of ageing of the oil) without recalibration.

An influence of the measurement from the container wall is to be disregarded by means of earthing (shielding on plug).

The programmable filter calculates the running average, and thus reduces the variations in the output signal without negatively affecting the accuracy.

The hysteresis of the switching point can also be adjusted by setting parameters.

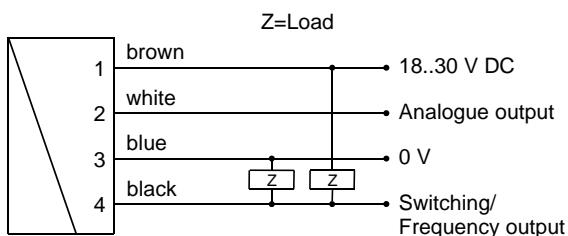

The electronics belong to the class of intelligent sensors from HONSBERG, and thus enable the use of the ECI-1 interface (configurator). The USB-compatible interface enables the adjustment of numerous parameters for adaptation to the application.

The devices are delivered pre-configured according to customer wishes.

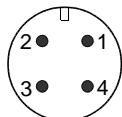

Technical data

Sensor	Capacitive	
Mechanical Connection	G1 thread with two fastening nuts (screw flange as accessory)	
Metering range	200, 400, 600 mm (others on request)	
Measurement uncertainty	$\pm 1\%$ full scale value	
Reproducibility	$\pm 1\text{ mm}$	
Pressure resistance	PN 5 bar (with sealed sensor)	
Long term stability	$\pm 1\text{ mm}$ after 100,000 cycles (0..100 % of level)	
Temperature dependency	$\pm 0.005\text{ mm} / 1\text{ K}$	
Medium temperature	-20..+85 °C (optionally 100°C)	
Ambient temperature	-20..+ 60 °C	
Supply voltage	18..30 V DC (regulated)	
Current requirement at rest	15 mA	
Analog Output	0..10 V or 4..20 mA	
Switching output	Push-Pull, 100 mA max. resistant to short circuits, reversed polarity protected	
LED (view from 4 sides)	yellow On = oil is within range Flashing = 10 % above min. level Off = oil is below min. level or > temperature limit (max. 95 °C) or defective. Flickering = with switchpoint programming with magnet. 2 x flashing confirms successful programming.	
Ingress protection	IP 67	
Materials medium-contact	Housing	CW614N nickelled
	O-ring	FKM (EPDM optional)
	Sensor	(NBR) FR4 (epoxy resin + fibreglass), gold-plated Cu
	Casting	Bectron PK 4342
Materials non-medium-contact	Housing	CW614N nickelled
	O-ring	NBR
	Plug	PA6.6
Weight	Sensor: 200 mm long 0.2 kg without flange Tube length: + 0.05 kg / 200 mm Flange: + 0.15 kg	
Conformity	CE	

Wiring

Connection example: PNP NPN

Before the electrical installation, it must be ensured that the supply voltage corresponds to the data sheet.

It is recommended to use shielded wiring.

The push-pull output of the frequency or pulse output version can as desired be switched as a PNP or an NPN output.

L = installation length (see ordering code),

L_m = metering range ($L-L_t-L_r$) Standard 0 – 100%

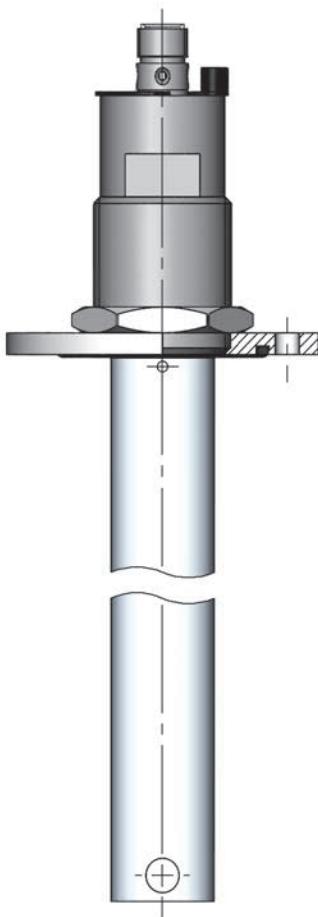

L_t = Dead zone 10 mm

L_r = Reference zone 26 mm

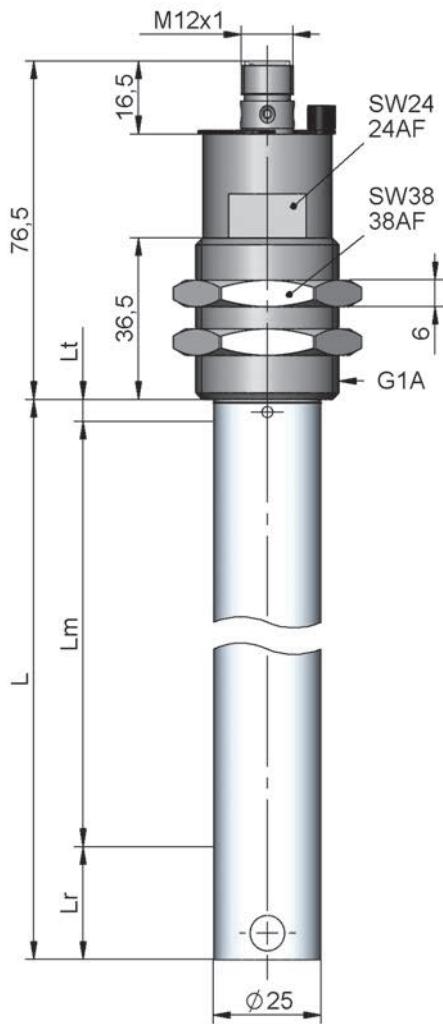

(always in the same medium as the measuring zone)

L_{min} = 10

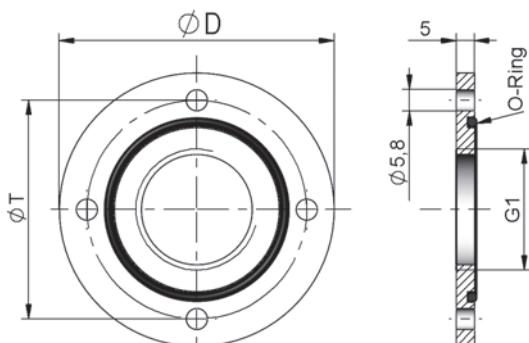

LCC2 with flange

Dimensions

Standard flange dimensions

D= 75
T= 60
C1= Tank hole 34 – 40 mm

Installation

The threaded version can be either directly screwed into (G1") a hole (34 mm) or fastened using two supplied nuts.

Alternatively, a screw-on flange can be fastened on the thread, which is also made specifically for the customer. In order to achieve a tight seal the flange must be made with a suitable thread seal on the LCC2 unit. The container must have a suitable sealing surface on which the O-ring seals the flange. The flange must be free of contamination and mechanical damage. Bolts should be tightened only enough for the flange to abut against the housing wall.

A magnet clip is used for programming the switching point - if this is desired - or for programming an offset to the start or full scales. Equally, the analog full scale may alternatively be programmed with the clip.

The clip can be inserted onto the plug connection or can be removed as a key.

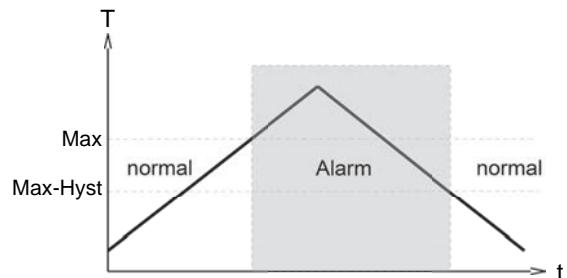

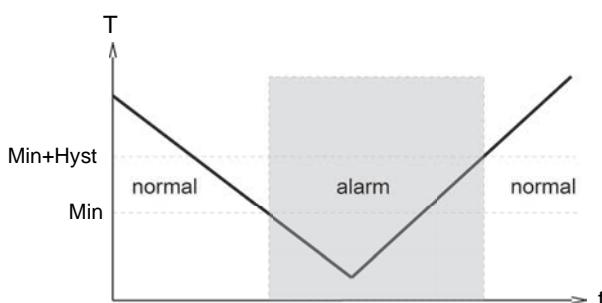

The location to which to apply the clip for one second is marked on the label.

If the programmable switching point is desired:

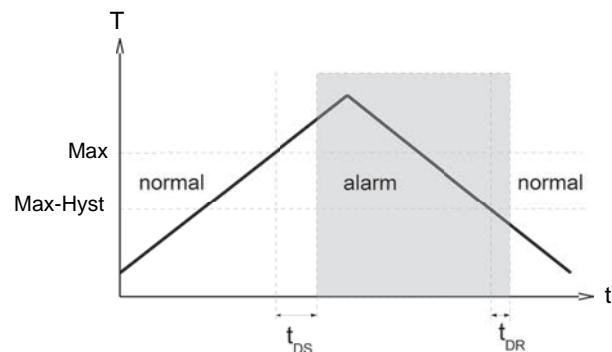

- Set the level to the switching value or to the value from which the offset was desired.
- Hold the magnet against the marking.
- LED flickers
- Remove the magnet from the marking. Two LED pulses acknowledge successful programming.

With a minimum-switch, falling below the limit value causes a switchover to the alarm state. Return to the normal state occurs when the limit value plus the set hysteresis is once more exceeded.

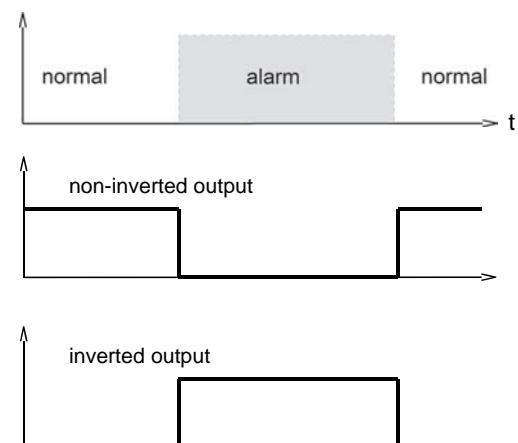

With a maximum-switch, exceeding the limit value causes a switchover to the alarm state. Return to the normal state occurs when the measured value once more falls below the limit value minus the set hysteresis.

A changeover delay time (t_{DS}) can be applied to switching to the alarm state. One switch-back delay time (t_{DR}) of several can likewise be applied to switching back to the normal state.

In the normal state the integrated LED is on, in the alarm state it is off, and this corresponds to its status when there is no supply voltage.

In the non-inverted (standard) model, while in the normal state the switching output is at the level of the supply voltage; in the alarm state it is at 0 V, so that a wire break would also display as an alarm state at the signal receiver. Optionally, an inverted switching output can also be provided, i.e. in the normal state the output is at 0 V, and in the alarm state it is at the level of the supply voltage.

A PowerOn delay function (ordered as a separate option) makes it possible to maintain the switching output in the normal state for a defined period after application of the supply voltage.
